Portfolio Backend Assignment 2

COMP229 Web Application Development | Mohamad Alkurdi

The portfolio backend implements Node.js and Express REST APIs with Mongoose, the Portfolio MongoDB database, and JWT authentication. All 24 required CRUD endpoints are implemented. The existing React contact form saves submissions to MongoDB.

Verification results

79 HTTP requests passed against a real, isolated MongoDB test database. The checks cover all CRUD operations, input validation, missing records, duplicate users, hashed passwords, protected routes, password changes, and token revocation after sign-out. Frontend production build and ESLint both passed.

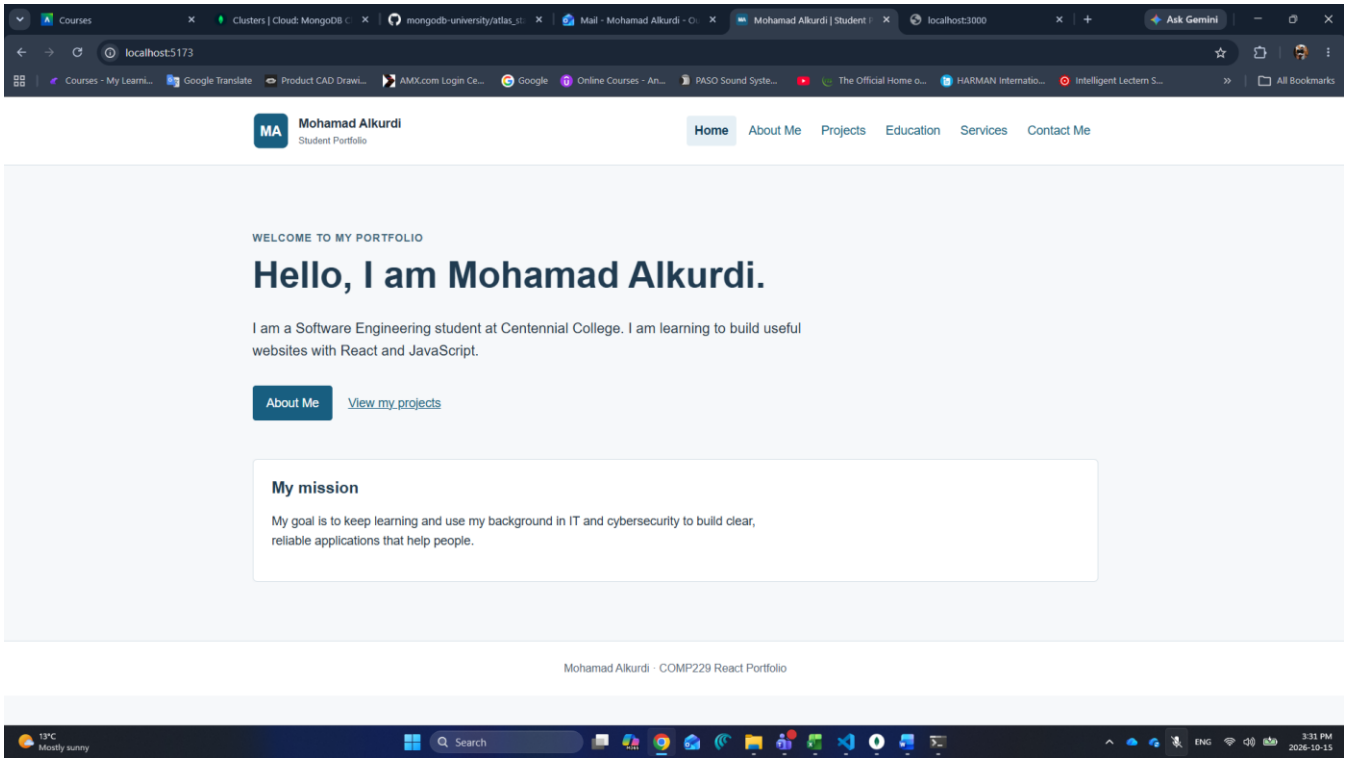

Evidence method

The welcome image is a browser screenshot of the running API. The database image displays an actual Mongoose connection and collection listing. API images are browser-rendered views of captured integration-test requests and responses, not Postman screenshots. Tokens and passwords are redacted. Complete raw evidence is included in evidence/api-results.json and a runnable Postman collection is supplied.

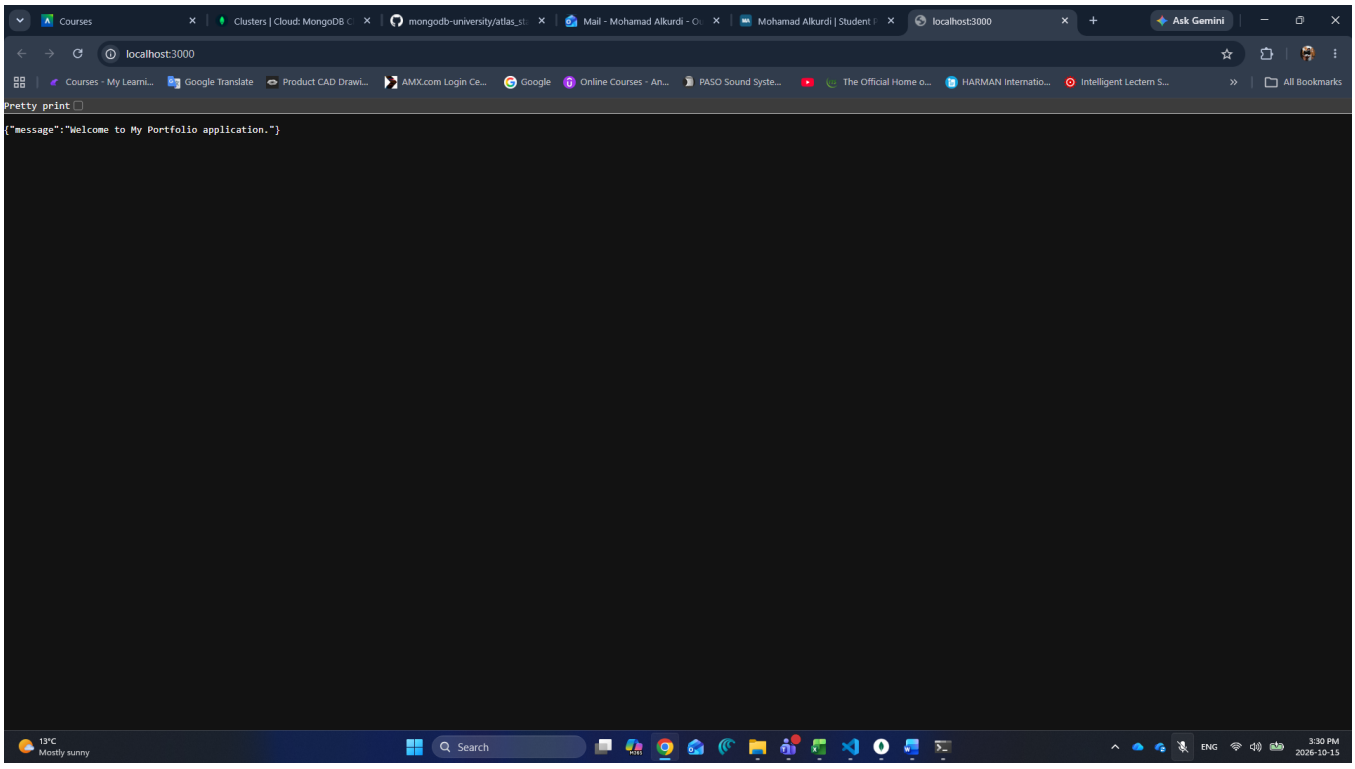

Running the project

Install dependencies in the root and client folders, configure .env from .env.example, start MongoDB, and run npm run dev. The frontend uses port 5173 and the backend uses port 3000. See README.md for commands and endpoint access rules.

frontend welcome response

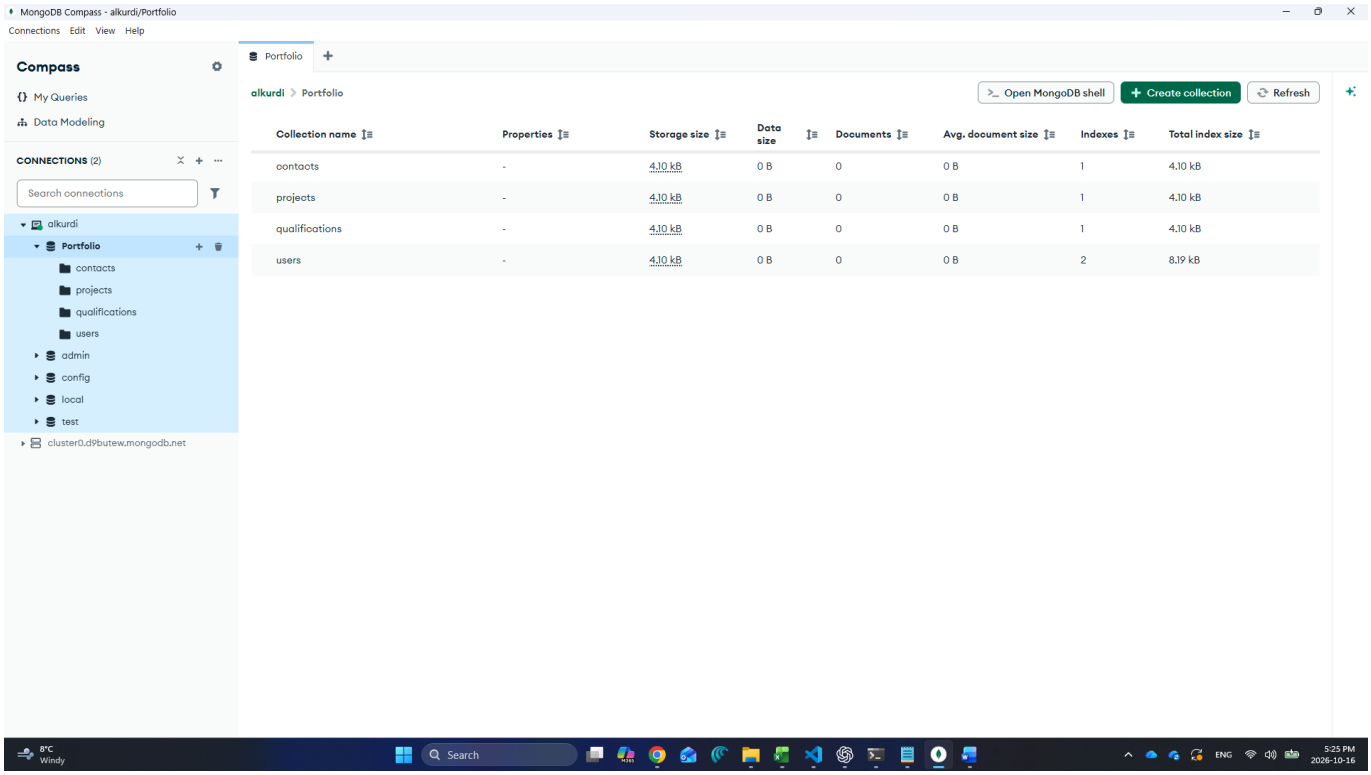

Backend welcome response

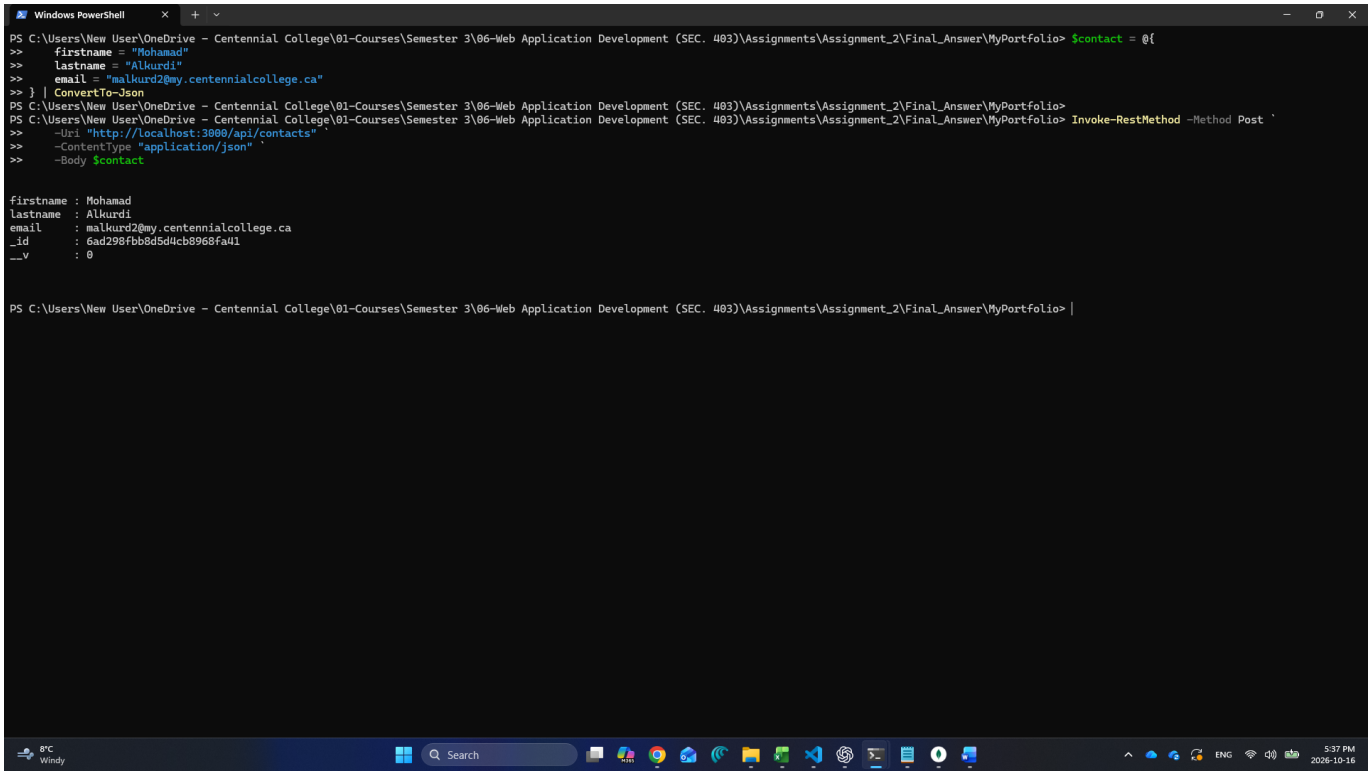

Captured from the local running backend and test results on 15 October 2026.

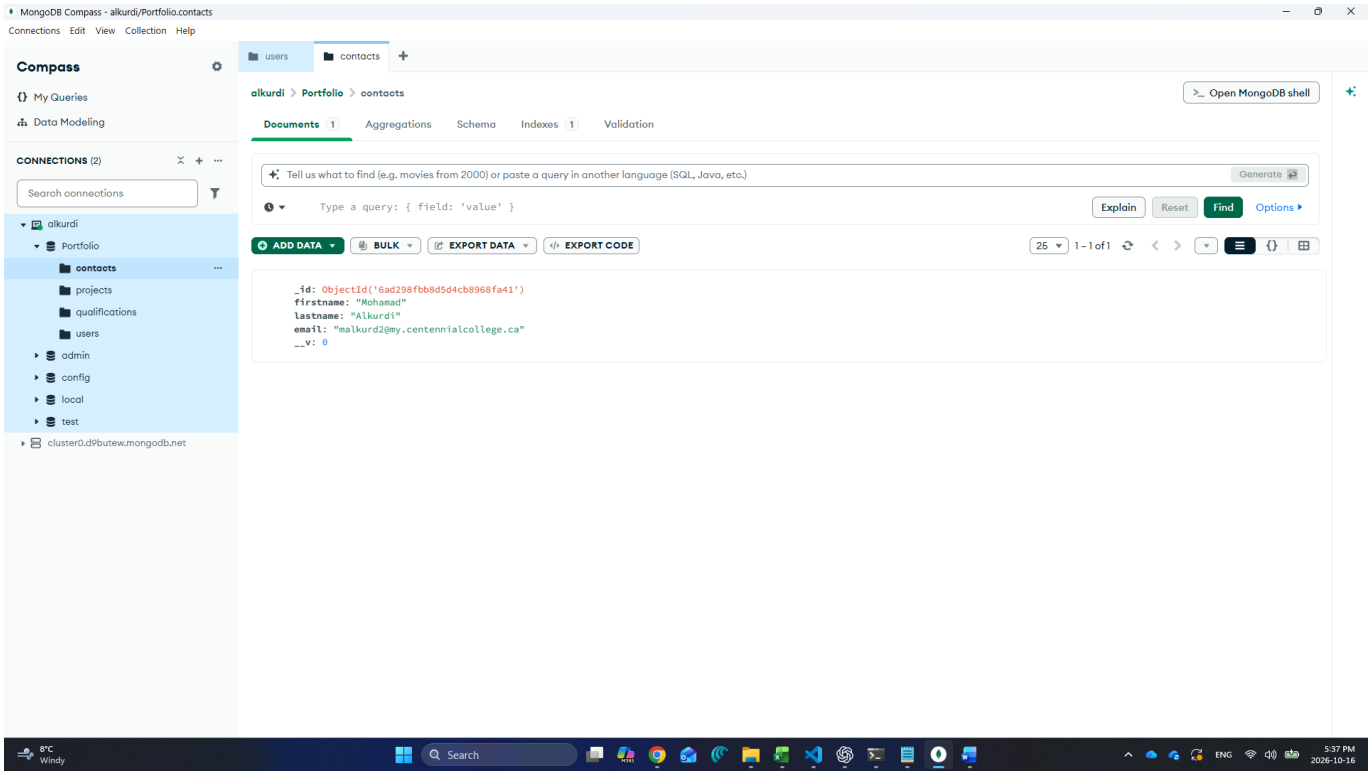

MongoDB database and collections

Captured from the local running backend and test results on 15 October 2026.

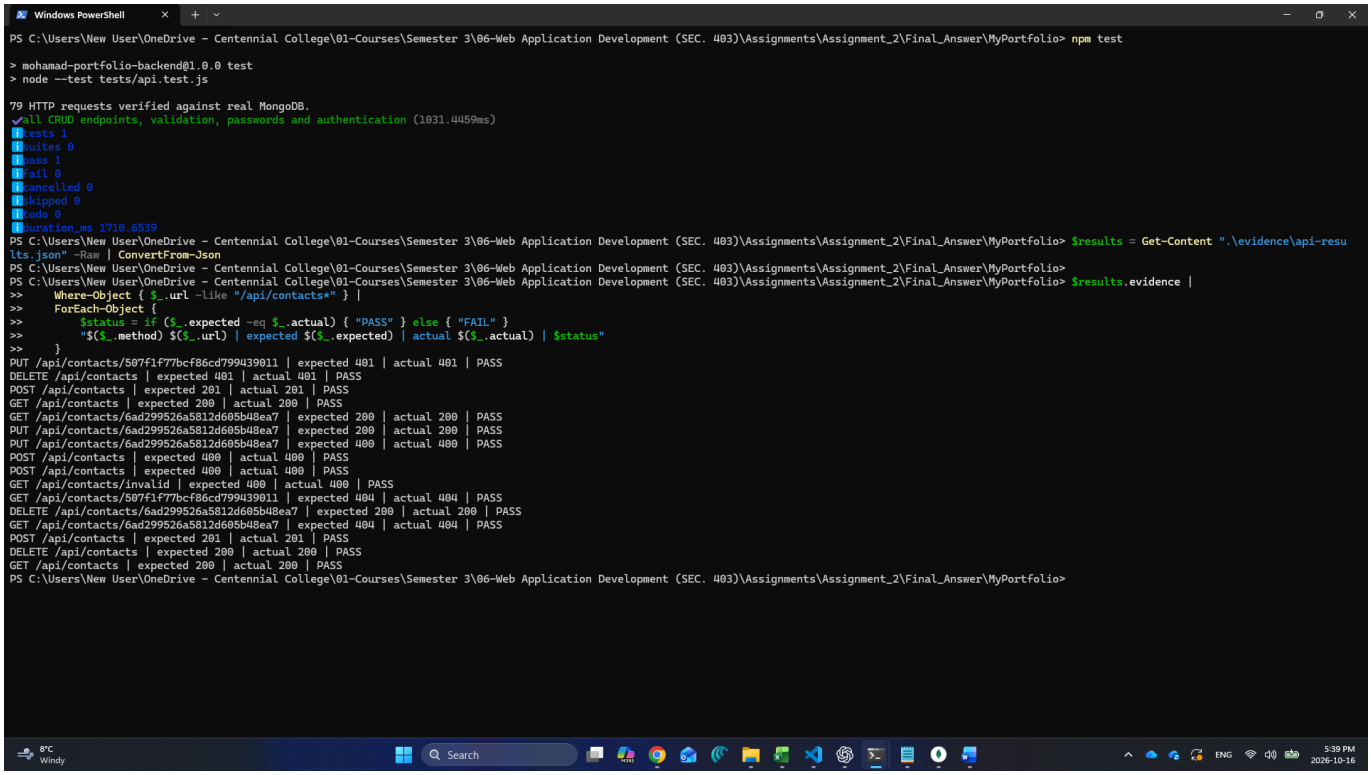

Contacts create request and response

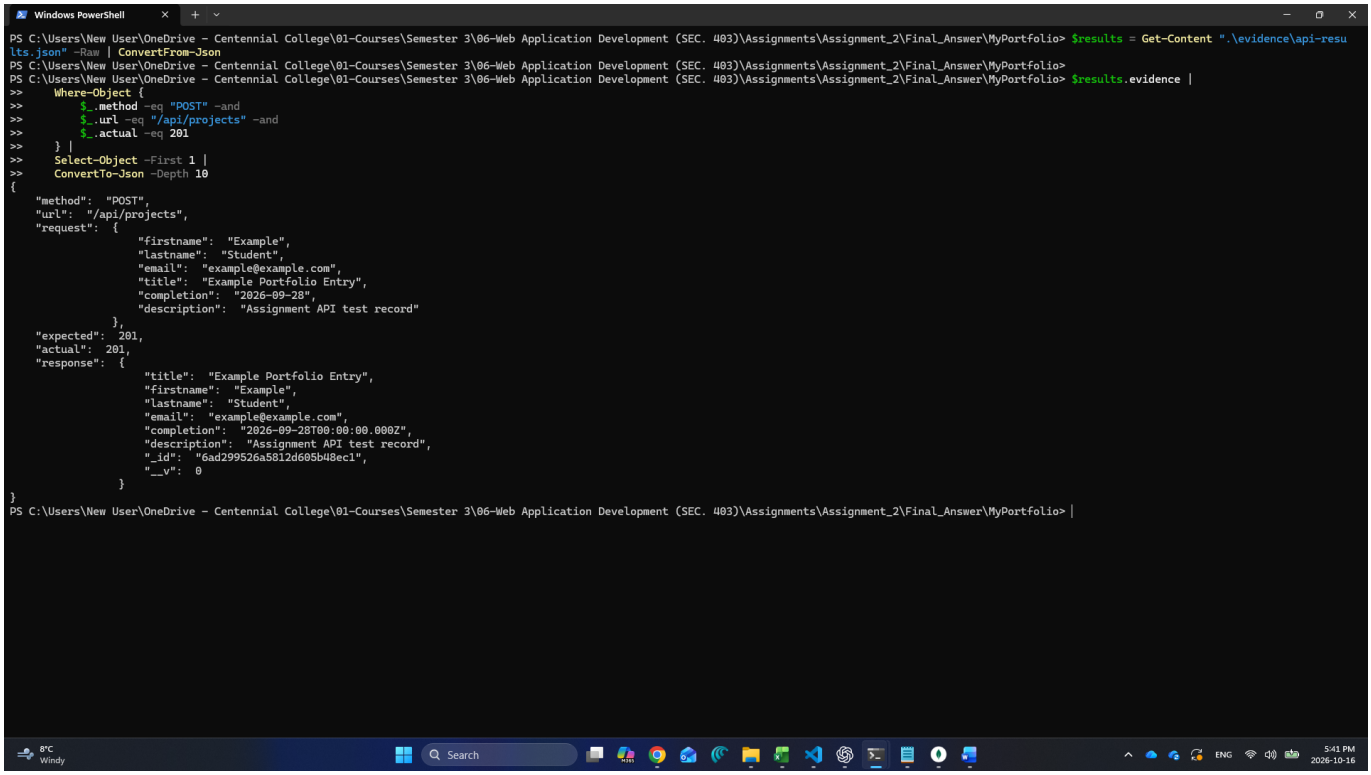

Captured from the local running backend and test results on 16 October 2026.

Contacts CRUD and validation checks

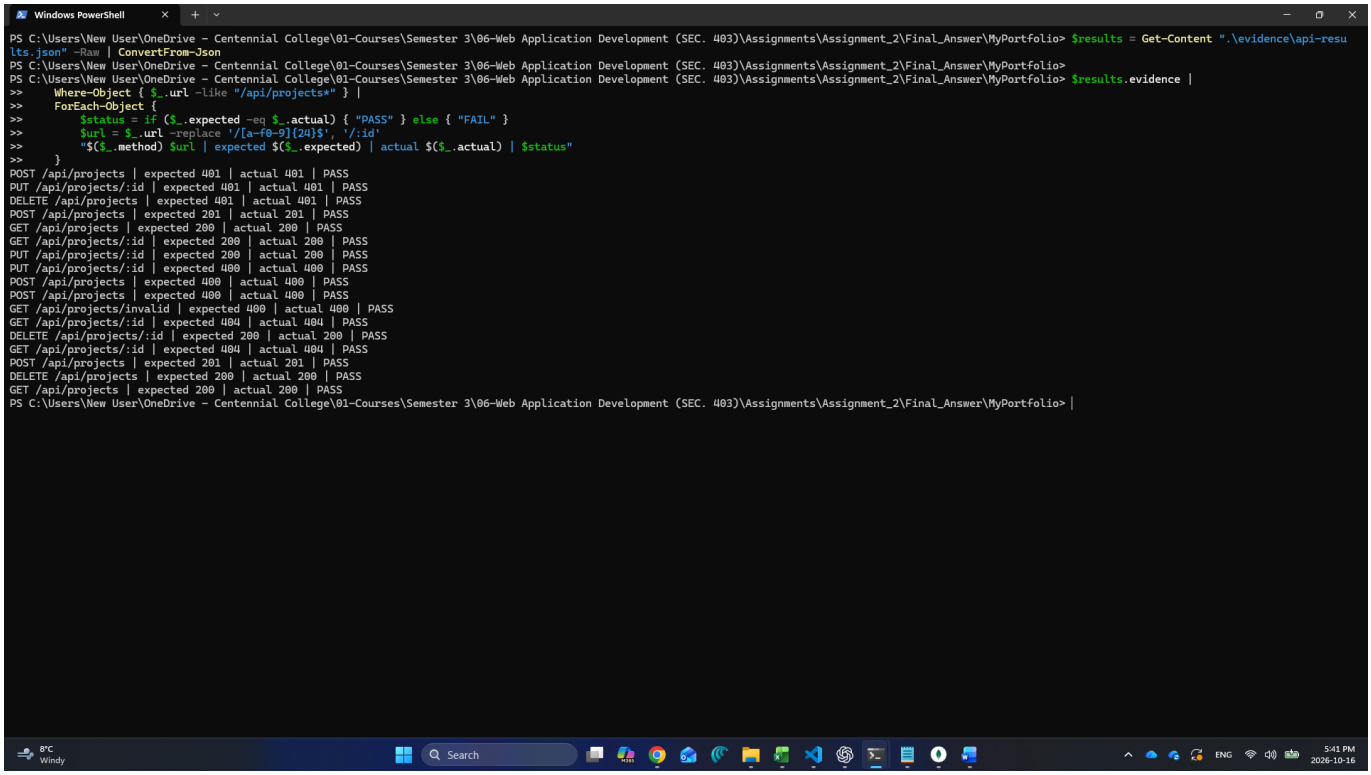

Captured from the local running backend and test results on 16 October 2026.

Projects create request and response

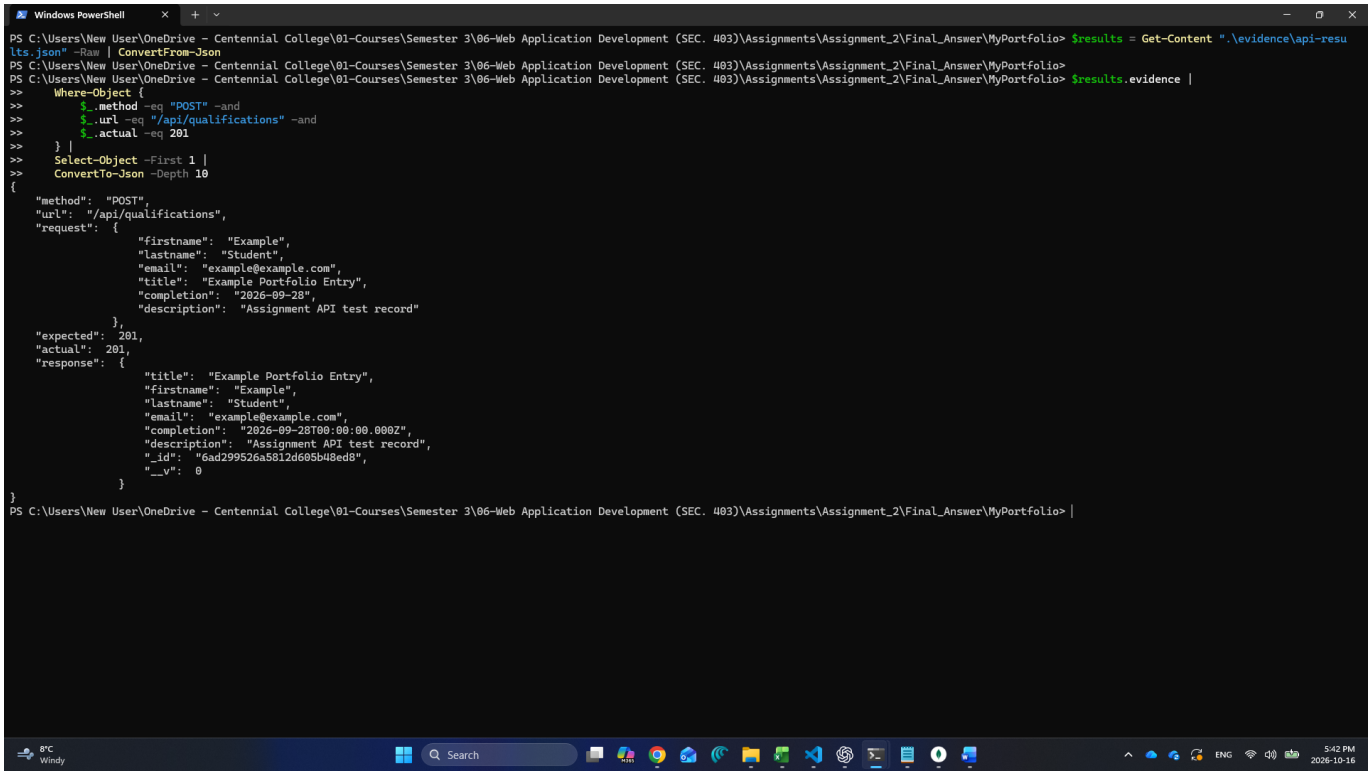

Captured from the local running backend and test results on 16 October 2026.

Projects CRUD and validation checks

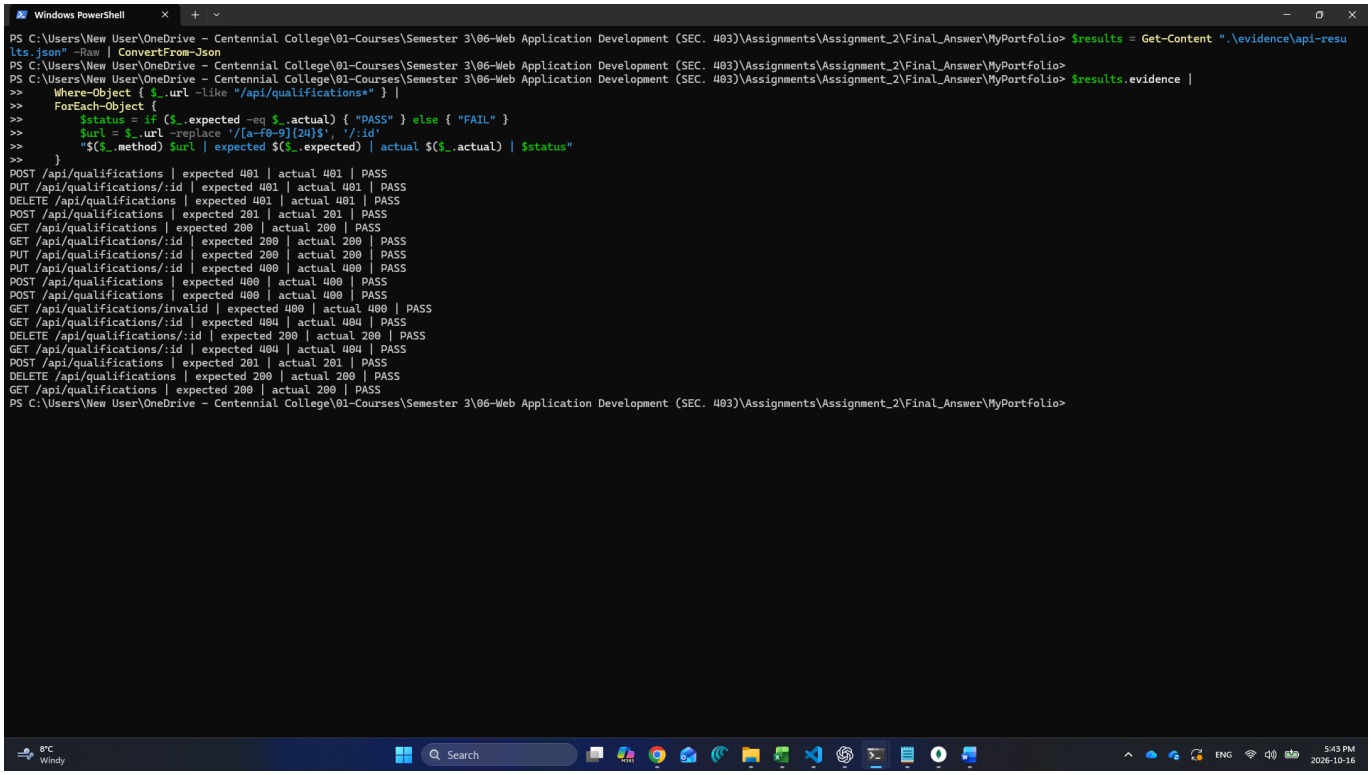

Captured from the local running backend and test results on 16 October 2026.

Qualifications create request and response

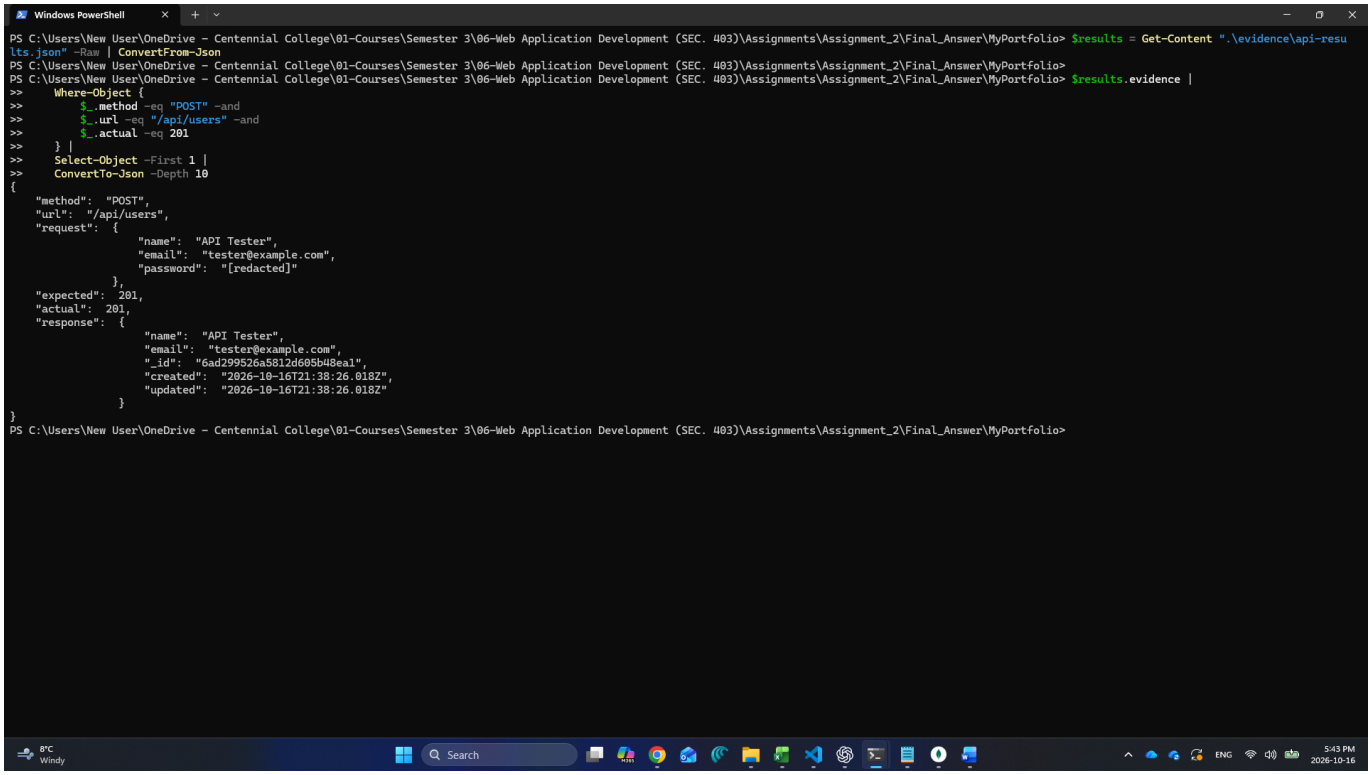

Captured from the local running backend and test results on 16 October 2026.

Qualifications CRUD and validation checks

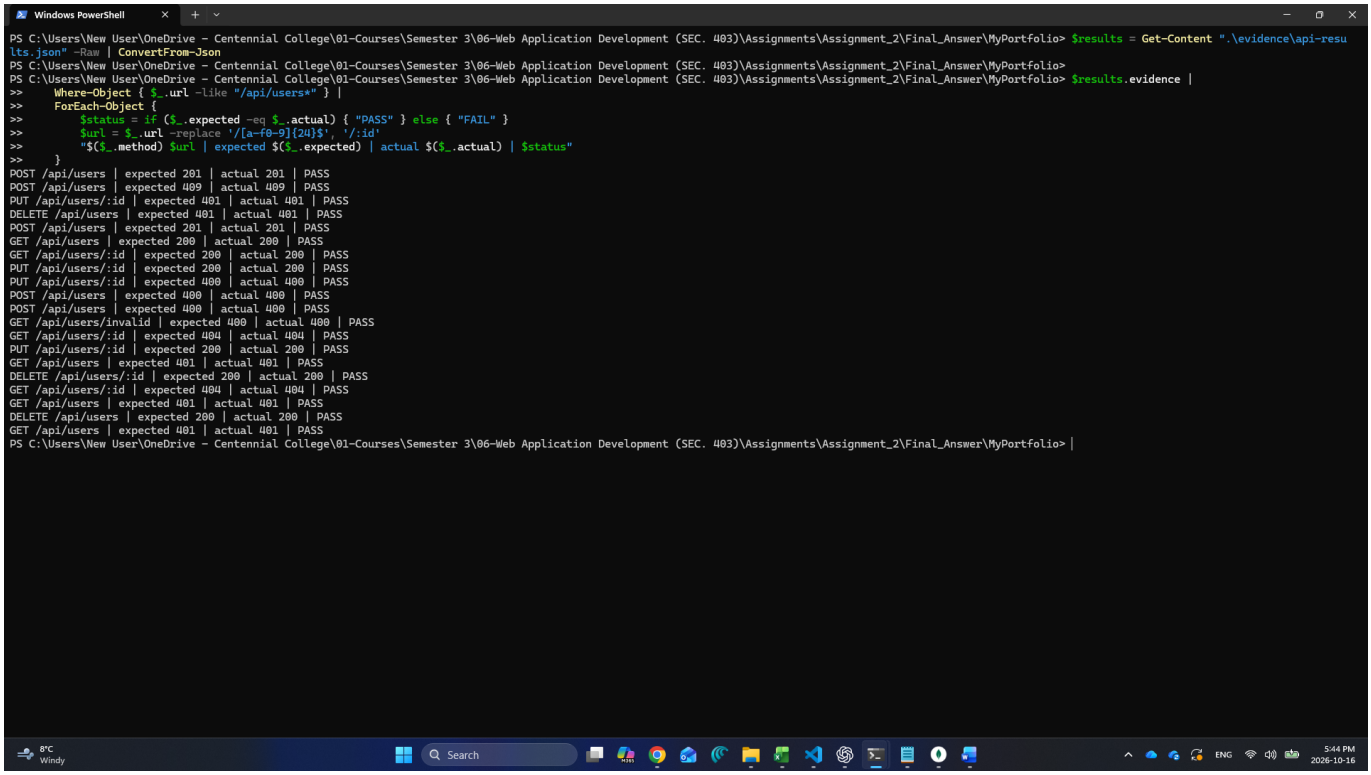

Captured from the local running backend and test results on 16 October 2026.

Users create request and response

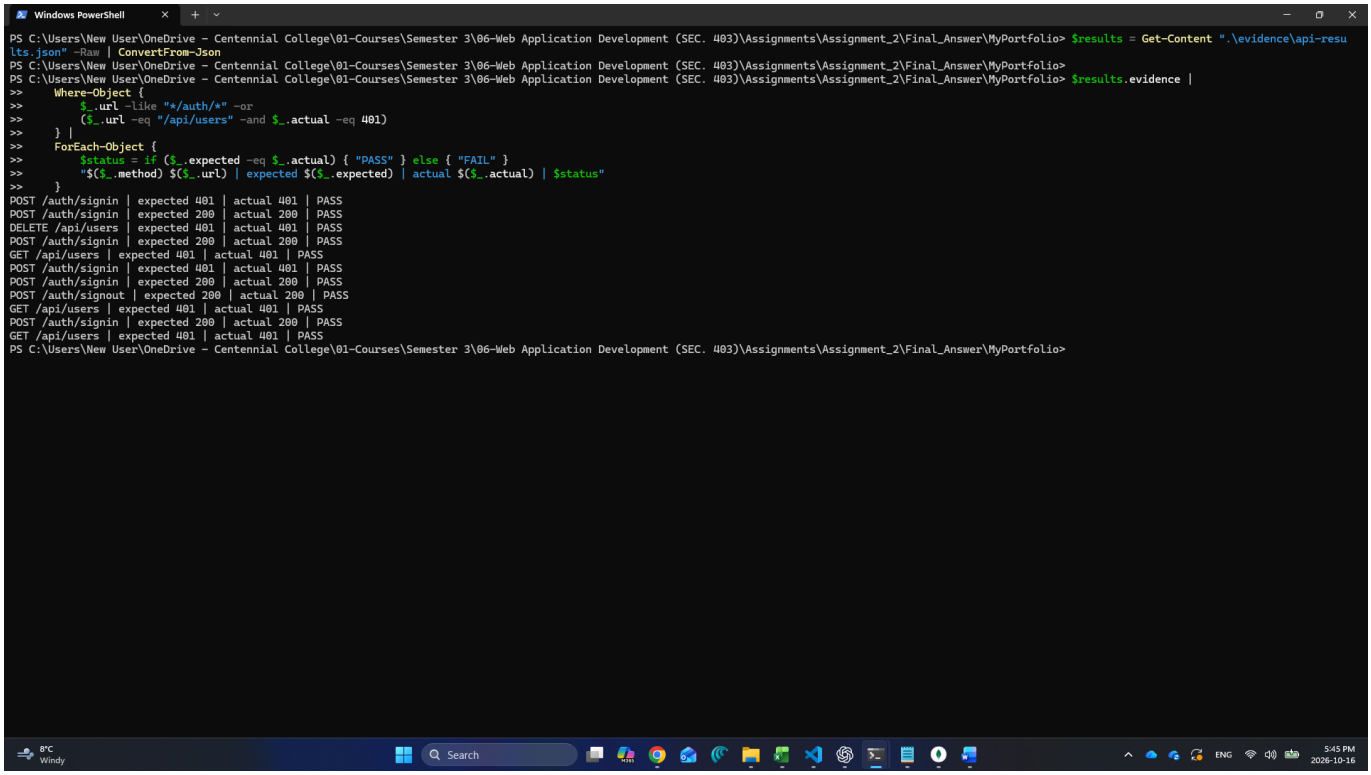

Captured from the local running backend and test results on 16 October 2026.

Users CRUD and validation checks

Captured from the local running backend and test results on 16 October 2026.

Authentication and sign out checks

Captured from the local running backend and test results on 16 October 2026.
